what is an user storyboard?

a **user storyboard** is a **visual sequence of screens or steps** that shows how a user interacts with an application from start to finish. it is basically like an cosmic strip for our application.

main goals:

- screens (login, home, payment, etc.)
- user actions (click, type, select)
- flow (what happens next)
- goal (like booking a ticket)

application choosen : bus ticketing system.

pros:

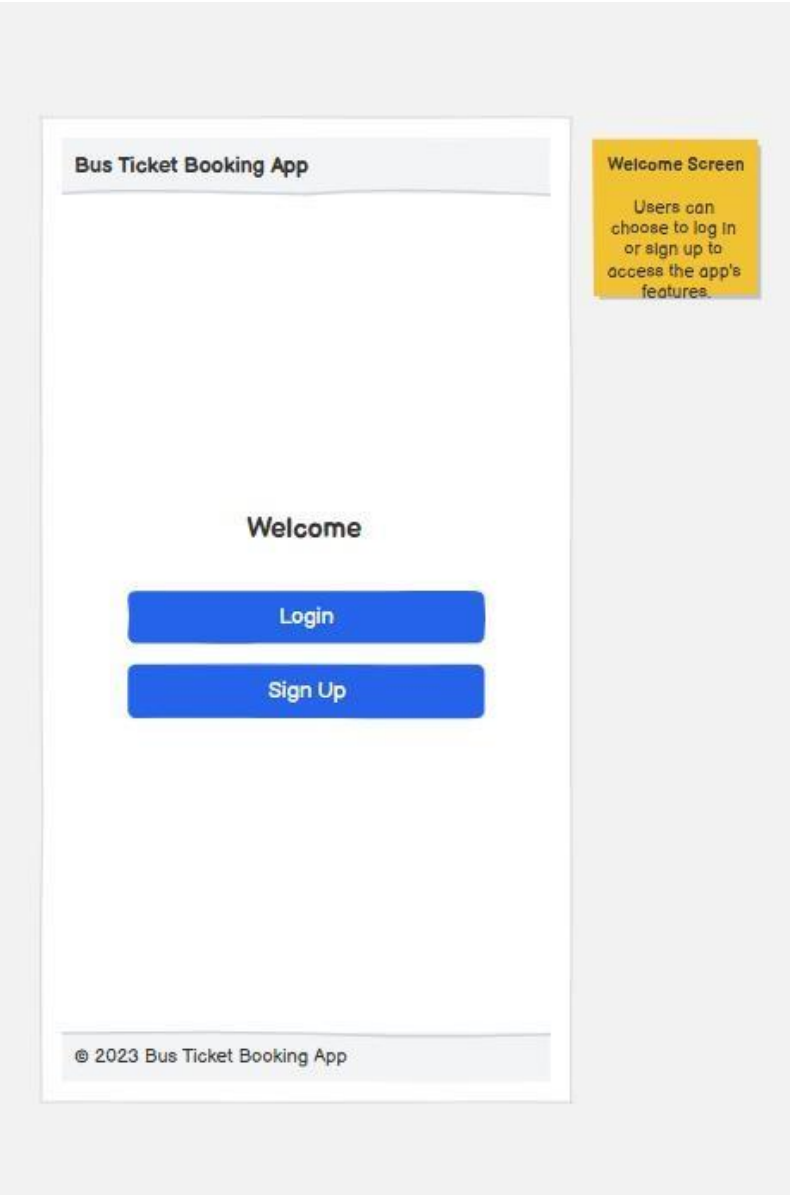
- easy to understand
- improves planning
- user-centered design
- saves time & cost

cons:

- time-consuming
- depends on creativity

User Storyboard

<u>userflow</u>: <u>welcome screen:</u>



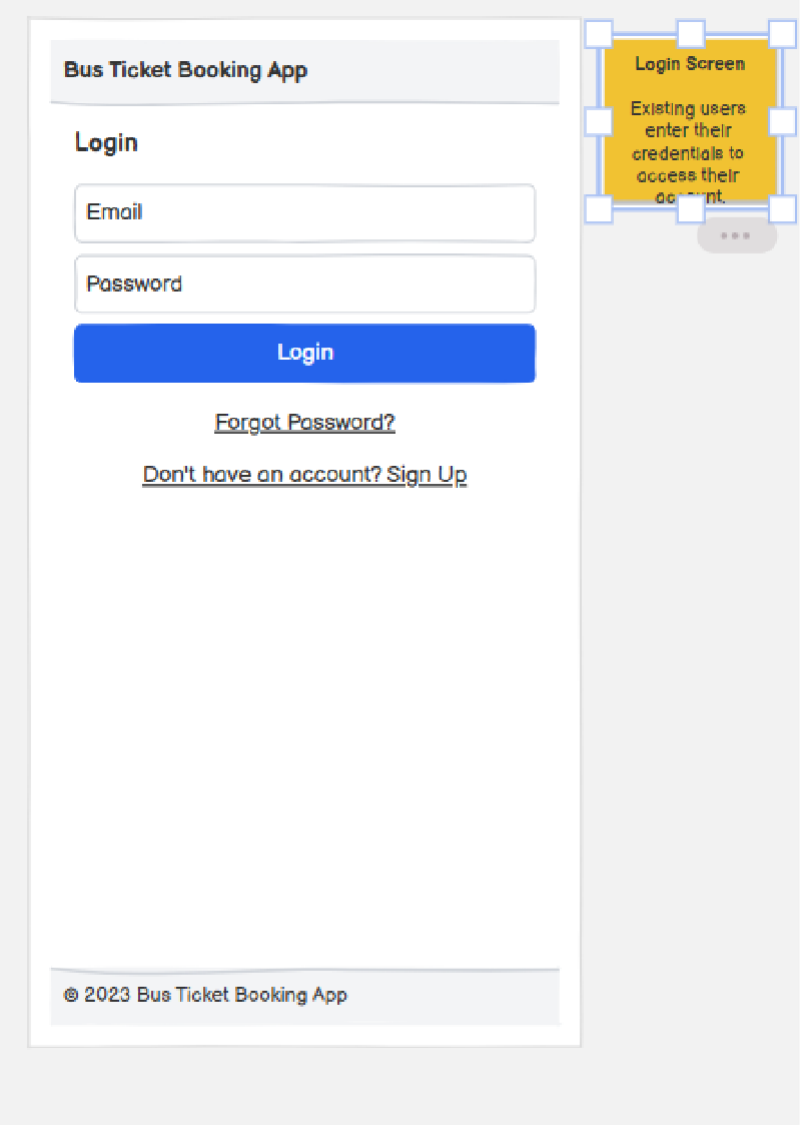
- this is the **first screen when user opens the app**
- it shows:
  - **login button**
  - **sign up button**

what happens:

user chooses whether they already have an account or need to create one.

User Storyboard

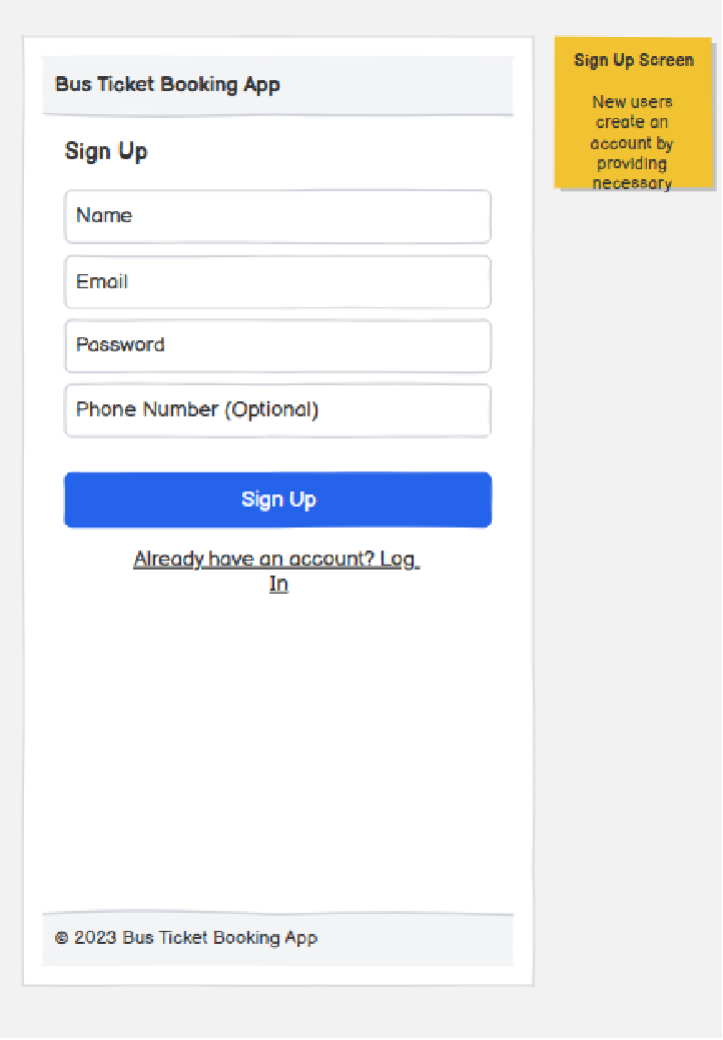
log-in screen:



- user enters:
    - email
    - password
- options:
    - login
    - forgot password &user to sign up account
    - what happens: existing users log in to their account

User Storyboard

sign up screen:



in this screen the new user enters:

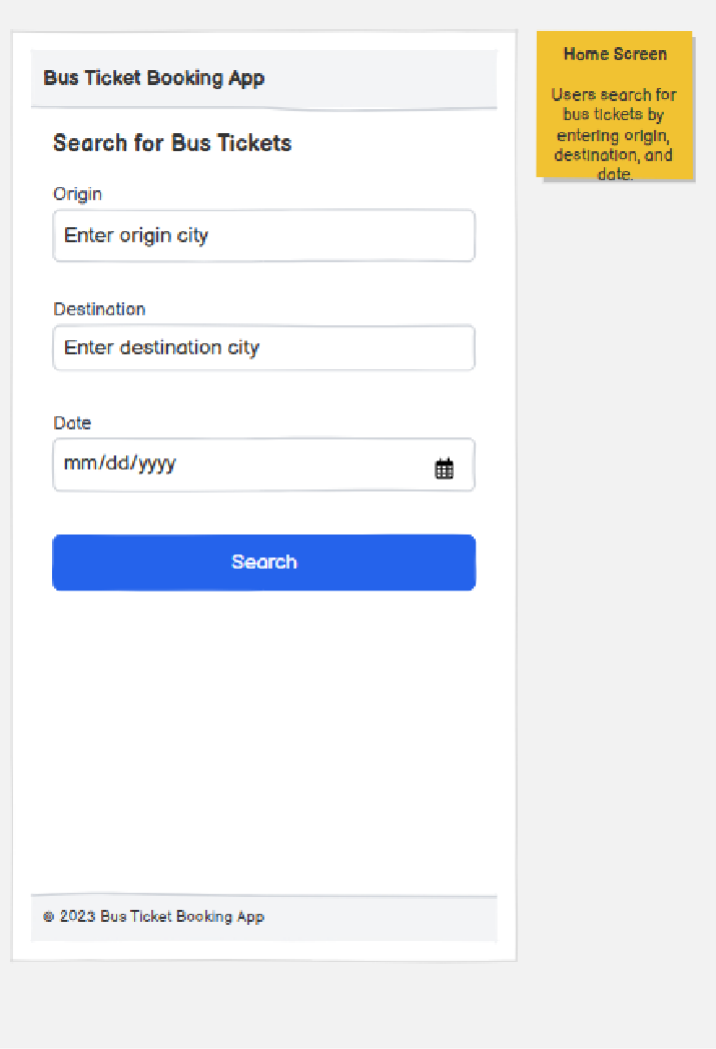
- name
- email
- password
- phone number

what happens:

user creates a new account to use the app.

User Storyboard

home_screen:



home screen (search entry)

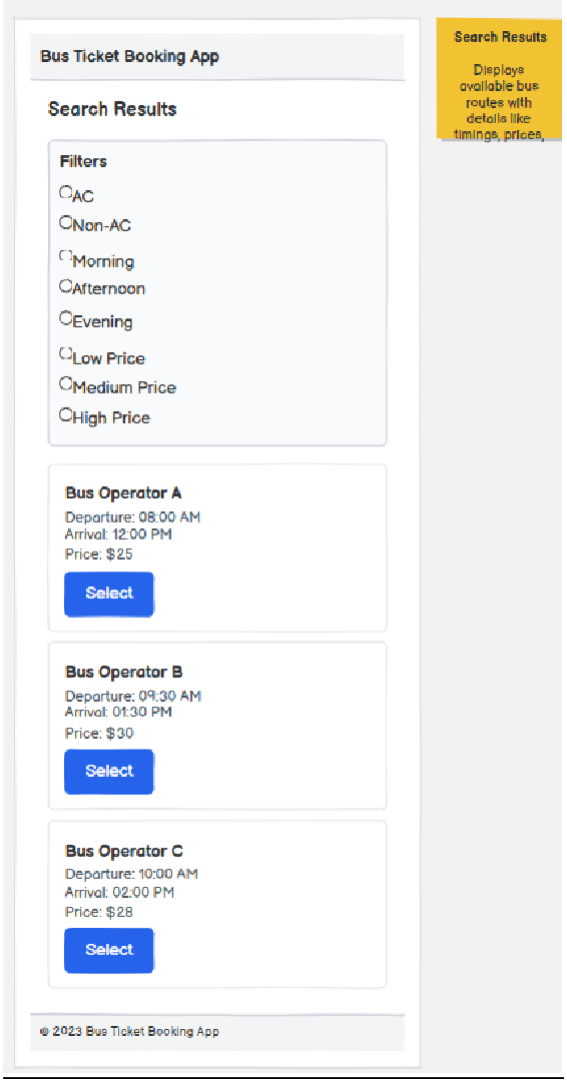
- this acts as the **main navigation page**
- user can start searching buses from here **what happens:**

acts as a hub where user begins the booking process.

by this way now user can view all the buses going to the required destination the user wants .so the users required informations are collected in this screen .

User Storyboard

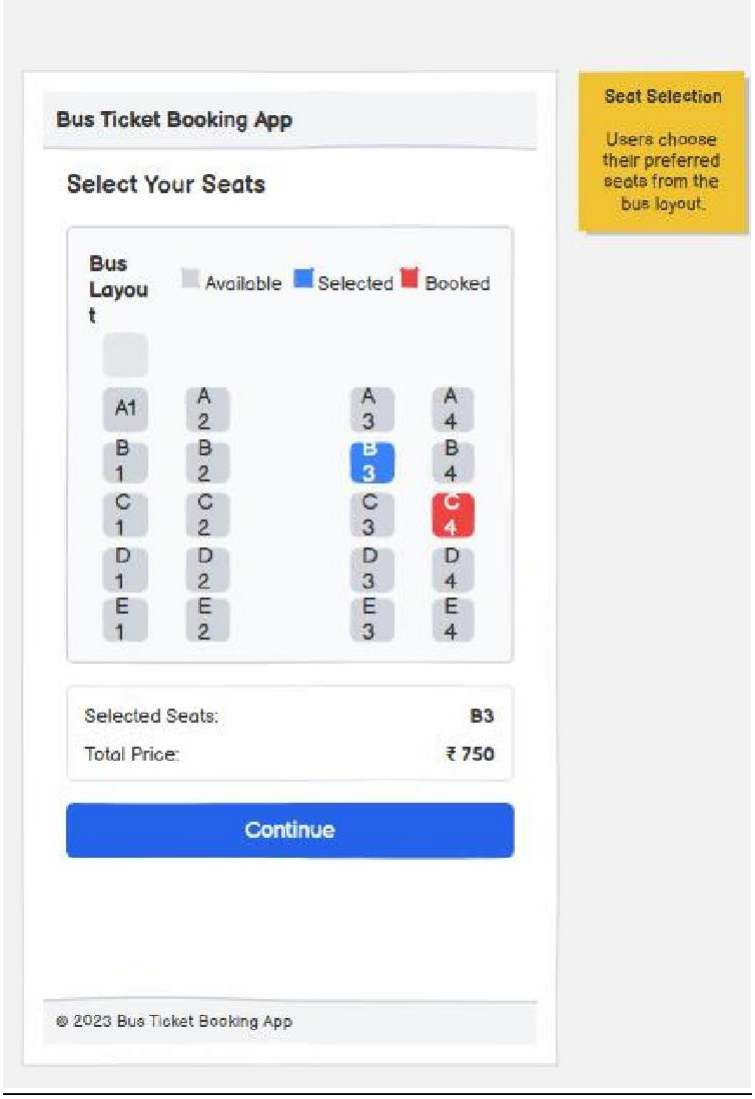
search result screen:



- displays list of available buses
- includes filters:
  - ac / non-ac
  - time (morning, evening)
  - price range
- each bus has:
  - details
  - **select button** (**what happens:** user compares options and selects a bus)

User Storyboard

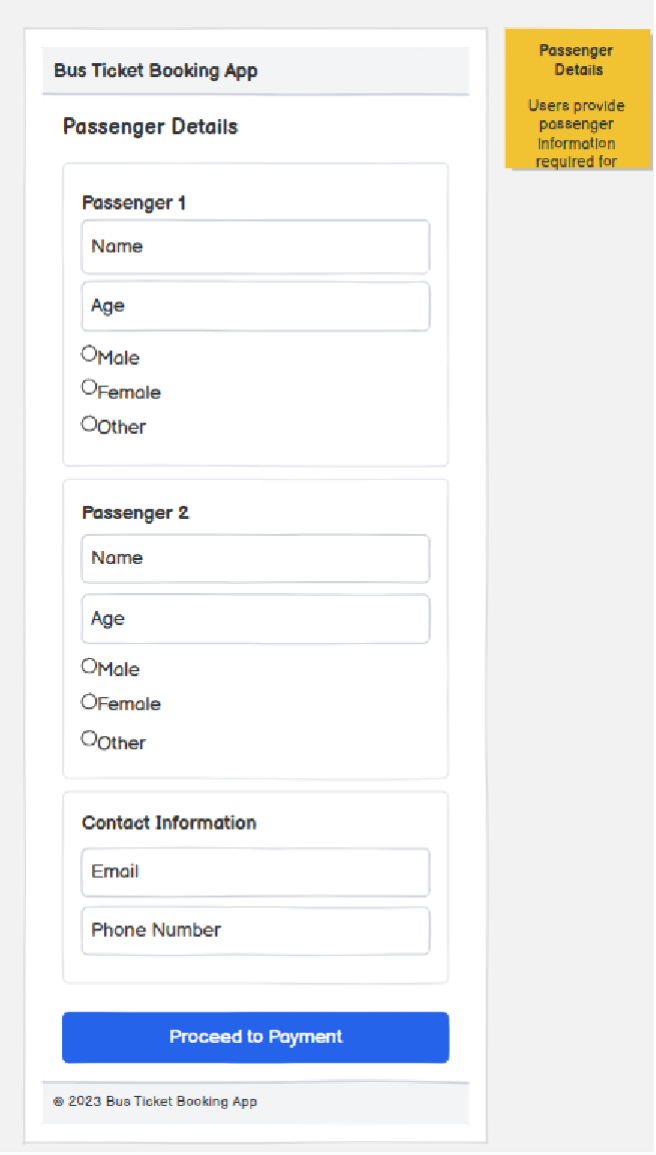
seat selecton screen:



- in this screen the application shows seat layout visually
- indicates:
  - available seats
  - booked seats
- **what happens:**
  user selects preferred seat(s).
- by this means the application can shows the availables seats accordance with users preffrences the seats are selected and further process is done.

User Storyboard

passenger details screen:



- user enters:
    - name
    - age
    - gender
    - contact info **what**

happens:

system collects passenger information for ticket booking. this way the information is collected hence once you get the regirstration done.

User Storyboard

PAYMENT SCREEN:

- displays:
    - booking id
    - bus details
    - seat number
    - travel info **what**

happens:

user gets confirmation that ticket is successfully booked.

thereby the userflow of this application of storyboards of bus ticketing system was understand by the using the tool balsamiq.

this storyboard shows the complete user journey of booking a bus.

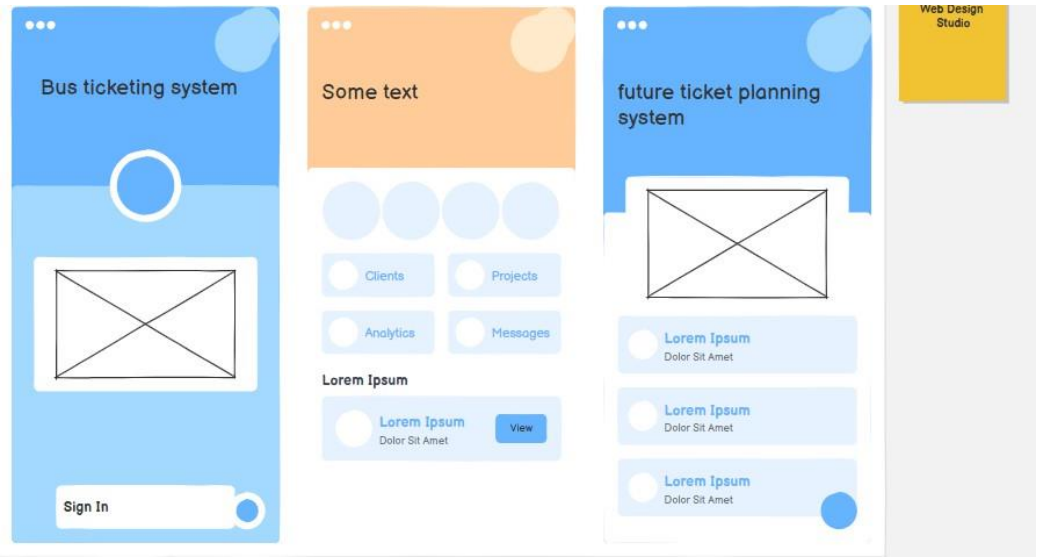
wireframing: (skeletal diagram)



- as for wireframing i have used balasmiq app to create the basic overall layout buy this way incorporating the ideas the images and text are added by this skeletal layout these wireframes are done using balasmiq using now this way the overall structural layout is drawn . the wireframe demonstrates the transition from a **complex ui to a simplified ui**.
- it highlights the importance of **clear navigation and minimal design**.
- the improved design enhances **usability, readability, and user satisfaction**.
- skeletal wireframing helps in identifying ui issues before final implementation.

full applied user storyboard:

- the fully applied ui design represents a **refined and user- friendly interface** for the bus ticket booking system.
- it includes **clear input fields** for source, destination, and travel date, making the booking process straightforward.
- the interface displays **available buses with details like timing, seat availability, and price**.
- proper use of **colors, spacing, and alignment** improves visual clarity and readability.
- action buttons like **"search bus" and "book"** are clearly highlighted for easy interaction.
- icons and visual elements are used to enhance **user understanding and navigation**. thereby it reduces the complex system and helps for the users navigation and guideance.
