Expt No: 1 Good design vs bad design roll no: 240701499

NAME: Shivam Jaiswal
DEPARTMENT: CSE

1. What is an good design ?

Design that feels intuitive, efficient, and pleasant to use. It typically:

- **Solves user problems** - addresses real needs effectively
- **Provides clarity** - clear visual hierarchy, obvious next steps
- **Reduces friction** - makes common tasks easy and quick
- **Follows conventions** - uses familiar patterns appropriately
- **Accessible to all** - works for diverse users and abilities

2. What is an bad design?

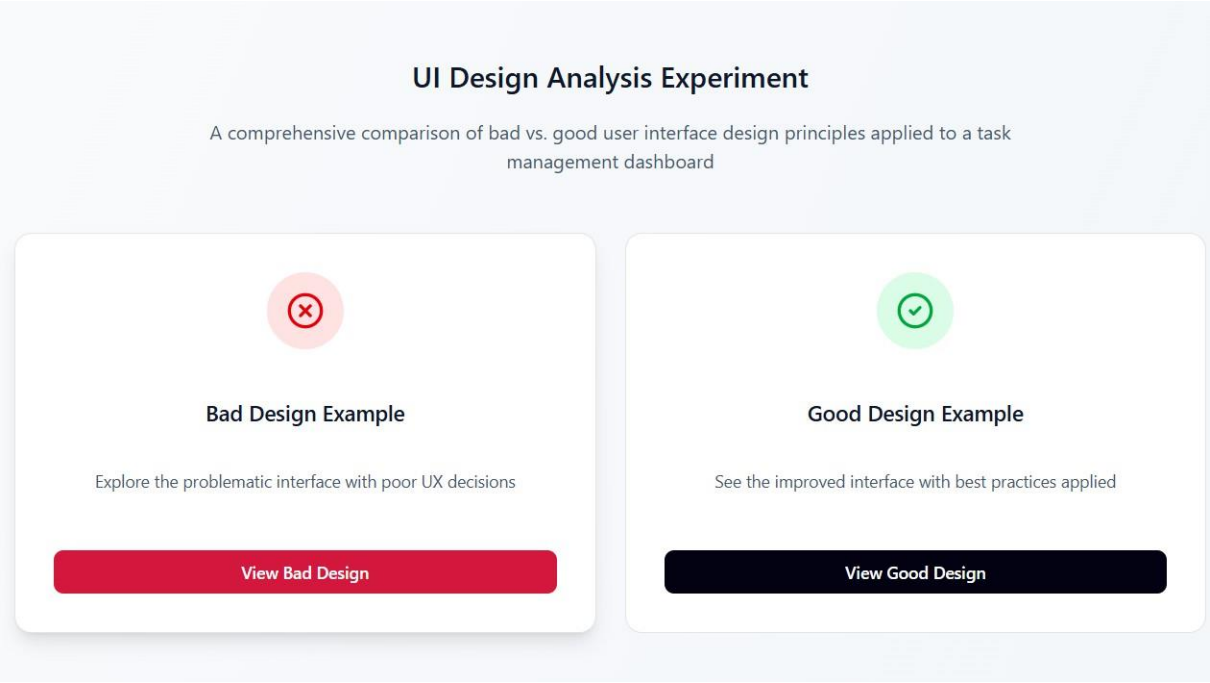
- The bad design example demonstrates poor UI practices such as lack of visual hierarchy, confusing layout, and ineffective use of colors. The interface does not guide the user properly, making navigation difficult and reducing usability. Important elements are not highlighted clearly, leading to user frustration and inefficiency.

Comparison

- The comparison highlights how small improvements in layout, color usage, and element placement can significantly enhance user experience. While the bad design creates confusion and inefficiency, the good design provides clarity, simplicity, and ease of use. Using these as our main goals we will successfully Implement and understand of how both the good design and bad design work in a way that the user can understands the difference and understands the powerful UI/UX. These are achieved using Figma as our application which distinguish both good and bad design to make the user UNDERSTANDS THE MAIN DIFFERENCE IS MADE AND IMPLEMENTED IN THIS AS OUR RESULT.

Expt No: 1 Good design vs bad design roll no: 240701499

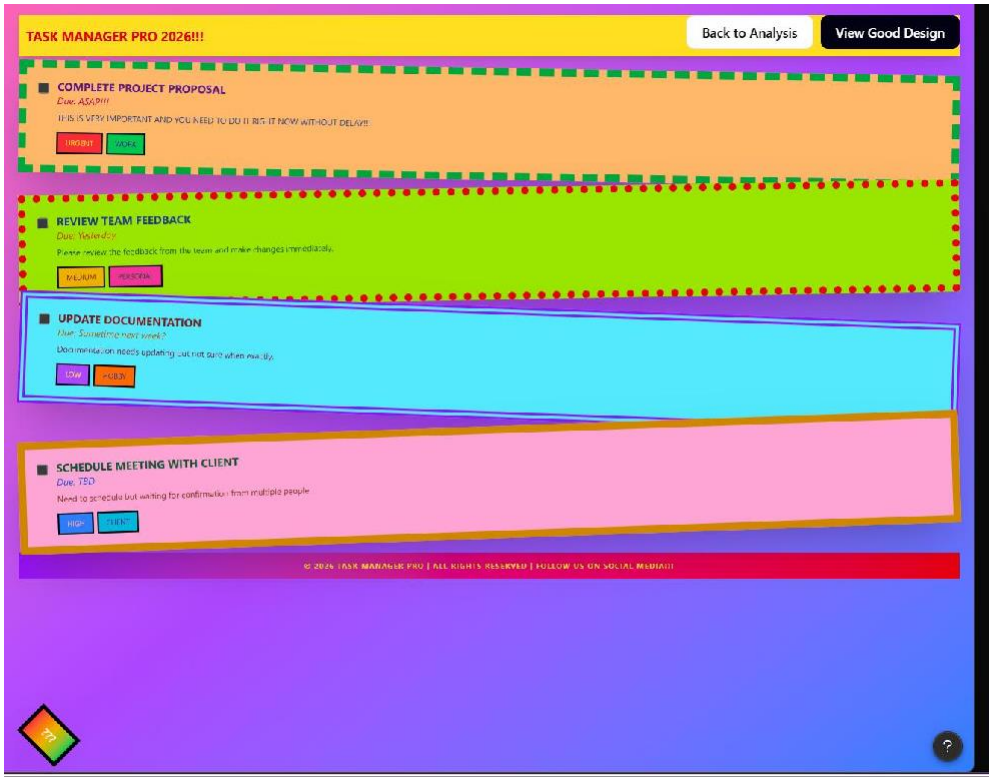
Application used: Figma (Task management system):



- Figma was used to design and prototype the task management dashboard interface. It provided an easy-to-use platform for creating both bad and good UI designs, allowing comparison of different design principles. The tool helped in arranging layout elements, applying color schemes, and visualizing user interaction effectively. This experiment focuses on comparing good and bad user interface design using a task management dashboard created in Figma. Two versions of the interface were designed to highlight the differences in usability and design principles. The bad design lacks proper structure and does not follow basic UI guidelines, making the layout confusing and difficult to understand. The use of colors is ineffective, and important elements are not clearly highlighted, which makes navigation harder for users. In contrast, the good design provides a clean and simple layout that improves user experience. It follows proper UI/UX principles with a well-balanced color scheme and clear visual hierarchy. Buttons are clearly visible and easy to use, and proper spacing and alignment enhance readability. Overall, the comparison shows that applying good design principles significantly improves usability, clarity, and user satisfaction.

Expt No: 1 Good design vs bad design roll no: 240701499

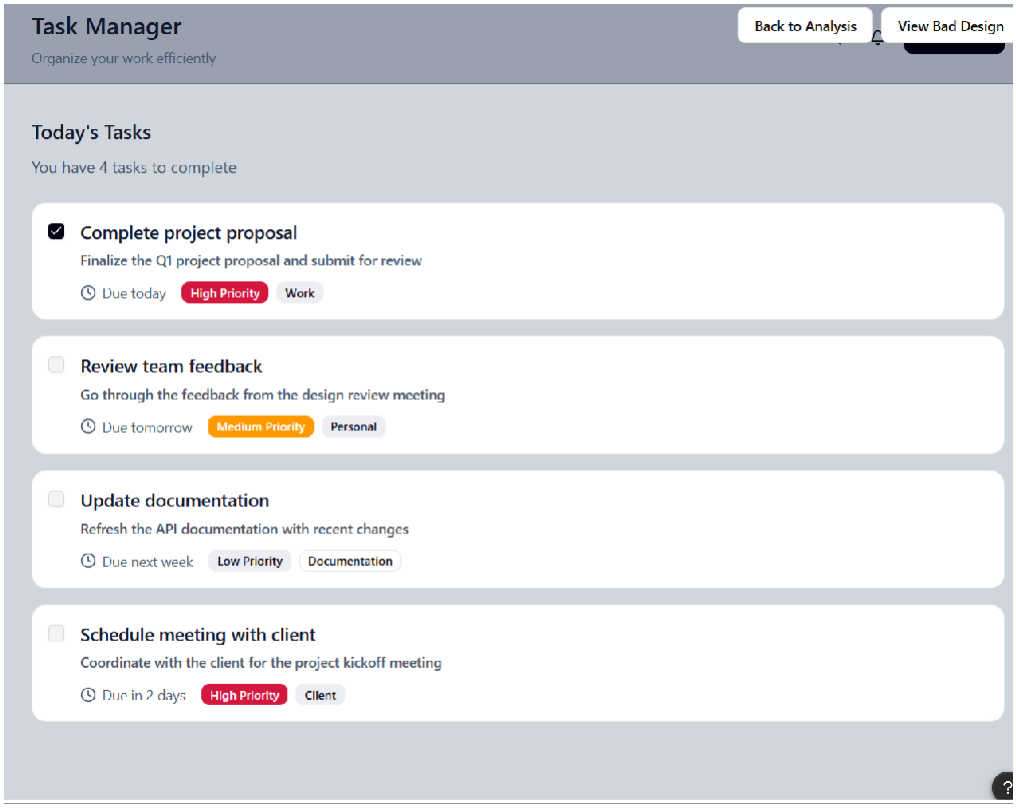
Bad design:



THIS INTERFACE REPRESENTS A POOR EXAMPLE OF USER INTERFACE DESIGN DUE TO ITS EXCESSIVE USE OF BRIGHT AND CLASHING COLORS, WHICH MAKES
THE SCREEN VISUALLY OVERWHELMING. THE LAYOUT LACKS CONSISTENCY AND ALIGNMENT, AS DIFFERENT SECTIONS ARE UNEVENLY SPACED AND IMPROPERLY STRUCTURED. THE USE OF MULTIPLE BORDER STYLES, SHAPES, AND
DECORATIONS CREATES UNNECESSARY DISTRACTION INSTEAD OF GUIDING THE USER'S ATTENTION. THERE IS NO CLEAR VISUAL HIERARCHY, MAKING IT DIFFICULT TO IDENTIFY IMPORTANT TASKS OR ACTIONS QUICKLY. THE TEXT READABILITY IS ALSO AFFECTED DUE TO POOR CONTRAST AND INCONSISTENT FONT USAGE. ADDITIONALLY, THE BUTTONS AND LABELS ARE NOT UNIFORMLY DESIGNED, WHICH REDUCES USABILITY AND CONFUSES THE USER. OVERALL, THIS DESIGN DEMONSTRATES HOW IMPROPER USE OF COLORS, SPACING, AND LAYOUT CAN NEGATIVELY IMPACT USER EXPERIENCE AND MAKE THE INTERFACE DIFFICULT TO UNDERSTAND AND NAVIGATE.

Expt No: 1 Good design vs bad design roll no: 240701499

Good design:



This interface represents a well-designed user interface that follows standard UI/UX principles. The layout is clean, structured, and easy to understand, allowing users to quickly identify tasks and their priorities. Proper use of colors helps differentiate task statuses, such as high, medium, and low priority, without overwhelming the user. The spacing and alignment are consistent throughout the interface, improving readability and visual balance. Clear typography and simple icons enhance user interaction, while the buttons and labels are intuitive and easy to use. Overall, the design ensures smooth navigation and provides a user-friendly experience.

Conclusion:

A well-designed interface helps users complete tasks efficiently, while a poorly designed interface leads to confusion and frustration. Therefore, applying good UI/UX principles is essential for creating clear, efficient, and user-friendly applications.
